<p>.....  Pentaerythritol esters of colophony. A. A. Tikhonov. <i>Doklady Akad. Nauk SSSR</i>, No. 3, 27-28, 1959, 1, 2039. When 1 mol. of pentaerythritol and 4 mols. of colophony were heated at 200-210° the reaction velocity was found to be greatest during the first 3-4 hrs., coming to a standstill after 7 hrs. The acid no. of the colophony decreased e. g., from 100.3 to 39.0 after 4 hrs. and to 16.2 after 7 hrs. The m. p. of the ester was 95° (m. p. of colophony 54°). The m. p. rises during the esterification, depending upon the materials used, by 21-41°. The esters were readily sol. in benzene, oil and ether. Their partial sol. in alc. makes possible their sepn. into a low-melting sol. portion of high acidity and a high-melting portion of slight acidity (85%). M. G. M.</p>

CA

Emulsion oils, their production and application. A. A. Tibbenmeyer. *Neftyanaya Prom.* 1941, No. 1, 78-81; *Khim. Referat. Zh.* 4, No. 9, 130-1 (1941).—Results of testing the phys.-chem. properties of emulsion oils and their behavior under production conditions, compared with avtol, nigrol and makiol, are given. The emulsifying lubricant is a water-in-oil emulsion, stabilized by Ca salts of fatty and naphthenic acids. The fundamental phys.-chem. properties of the system formed differ sharply from those of the components. The  $\eta$  of the lubricant increases sharply. The strength of the emulsion films is 2.5 times greater and the coeff. of friction lower by 30% than those of avtol. Under production conditions the emulsion oil shows less wear and a lower consumption of fuel than does avtol. The application of emulsion lubricants decreases by 50% the amt. of the lubricant needed and increases the useful life of the lubricant 3-4 times. W. R. Henn

TITLE: Thermodynamic properties of liquid solutions of the aluminum-tin system

SOURCE: IVUZ. Tsvetnaya metallurgiya, no. 4, 1966, 22-27

TOPIC TAGS: solution property, aluminum, tin, thermodynamic property

ABSTRACT: The investigation was made by the method of electromotive force. One of the electrodes was liquid aluminum, and the other a liquid alloy of Al-Sn of varying composition. The electrolyte was a mixture of anhydrous sodium and potassium chlorides in equimolar proportion, with an addition of  $AlCl_3$ . The electrolytic cell was made of a lump of magnesite brick with blind openings for the electrodes and the thermocouple. The current carriers were tungsten wires protected by alundum jackets. The cell was placed at the bottom of a quartz test tube with a diameter of 50-60 mm. The experiments were carried out in an electric resistance furnace. The experimental results are given in tabular form. The following conclusions were drawn:  
 1) Measurement of the electromotive force was made at temperatures from 700 to 850°;  
 2) the system studied exhibited measurable positive deviations from Raoult's law,

Card 1/2 UDC: 669.715+669.65

L 08191-67

ACC NR: AP6030498

evidently due to the presence of large deviations of the heat capacity from Kopp's law; 3) the dependence of the activities of the components on the composition, to a known approximation, can be described by the formulas for regular solutions; 4) the thermodynamic data obtained agree satisfactorily with the results of calorimetric and electronographic investigations. Orig. art. has: 5 formulas, 5 figures and 3 tables.

TITLE: A mechanism for sealing the rims of automobile tires.<sup>15,44</sup> Class 39, No. 172979<sup>16</sup>

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 14, 1965, 75

TOPIC TAGS: industrial automation,<sup>14</sup> vulcanization, rubber working machinery

ABSTRACT: This Author's Certificate introduces a mechanism for sealing<sup>17</sup> the rims of automobile tires. Mounted on the shaft of the assembly machine is a drive mechanism for a circular spring with thrust levers. The drive mechanism for the circular spring is made in the form of a ring-type pneumatic cylinder hinged to the thrust levers which carry the circular spring to increase the range of applications of the assembly machine and the operational use between repairs.

AUTHOR: Tikhomirov, A. I. SOV/20-121-1-42/55

TITLE: Seichic currents in the Straits of the Yokimvar Bay of the Ladoga Lake (Seyshevyye techeniya v prolivakh Iakimvarskogo zaliva Ladozhskogo ozera ) (Observations of 1957) (nablyudeniya 1957 g.)

PERIODICAL: Doklady Akademii nauk SSSR, 1958, Vol. 121, Nr 1, pp.149-151 (USSR)

ABSTRACT: Currents caused by seiches in lakes have been known for a long time. However, hardly any data are known from publications concerning periodic currents with a varying direction. Such periodic currents were found by the author in the cliff region of the aforementioned bay. On August 31<sup>st</sup>, 1957 the current changed within a period of one hour (Table 1, Fig 2). Wind velocity amounted to 2 - 5 m/sec. At a wind velocity of 1,0 - 1,5 m/sec and at calm the current had a period of 20 minutes (Fig 2 b). The average velocity amounted to 0,17 m/sec. Water temperature varied by 0,7<sup>o</sup>, when the current direction was inversed. A current changing its direction every 30 minutes was observed at the station Nr 1 (Fig 1)

Card 1/2

SOV/20-121-1-42/55

Seichic Currents in the Straits of the Yakimvar Bay of the Ladoga Lake  
(Observations of 1957)

on August 11. A comparison of the period of water level fluctuations taken from the limnograph with the period of the variable direction current proves this current to be a seichic current according to its nature. From the same figure it can be seen that the current velocity is zero when the level attains its extreme values. This fact substantiates the theoretical assumptions of an interrelation of the seichic fluctuation of the level with the seichic current (Ref 1). There are 3 figures, 1 table, and 1 reference, which is Soviet.

PHASE I BOOK EXPLOITATION

607

Drinberg, A. Ya.; Gurevich, Ye. S.; and Tikhomirov, A. V.

Tekhnologiya nemetallicheskih pokrytiy (Technology of Nonmetallic Coatings)  
Leningrad, Goskhimizdat, 1957. 388 p. 10,000 copies printed.

Ed.: Agranat, B. L.; Tech. Ed.: Erlikh, Ye. Ya.

PURPOSE: This textbook is designed for students of chemical and technological institutes and faculties. It may also be useful to engineers and technicians whose work is concerned with the manufacture of paint, machinery, motor vehicles, tractors, wood products, instruments, and electrical equipment.

COVERAGE: The book deals with the following: problems of protection against corrosion; the theory of film formation; properties of various coatings; painting of metals, wood, fibrous materials, plaster, and concrete; ornamental and simulative finishes; equipment for application of paints, lacquers, etc. A special section is devoted to the planning of painting shops. Authorship of the various parts of the book is as follows: A. Ya. Drinberg (deceased): Introduction,

Card 1/16

Technology of Nonmetallic Coatings

607

Chapters II, III, IV, V, VIII, X, XII, and XIII; Ye. S. Gurevich: Chapters I, VI, VII, IX, and XI; A. V. Tikhomirov (deceased): Chapters XIV, XV, XVI, XVII, and XVIII. The authors express their thanks to the reviewers Professor G. L. Yukhnovskiy, and S. V. Yakubovich, Candidate of Technical Sciences, for their valuable suggestions. For references, see Table of Contents.

TABLE OF  
CONTENTS:

Preface	9
Introduction	11
Ch. I. Theoretical Basis of Anticorrosion Protection	15
1. Basic concepts	15
Definition of corrosion (15). Types of metal corrosion (15).	
Structure of metals and solutions (17). Processes at the metal-solution boundary (20).	

Card 2/16

Technology of Nonmetallic Coatings

607

2. Electrochemical theory of corrosion	21
Electrode potentials (21). Principle of the voltaic cell (23).	
Polarization and depolarization (24). Schematic representations of corrosion processes (27). Theory of local and multielectrode cells (30).	
3. Passivity of metals	31
Theory of passivity of metals (32).	
4. Effect of various factors on corrosion	34
Internal factors (34). Effect of concentration and composition of the corrosive medium (35). Concentration of oxygen (36). Speed of action of the solution (36). Temperature (37).	
5. Individual types of corrosion	37
Chemical and gas corrosion (37). Atmospheric corrosion (38). Corrosion in sea water and in solutions of salts (40). Corrosion in soil (41).	
6. Methods of protection against corrosion	42
Choice of metal, method of treating it, and rational design (42). Electrochemical protection (43). Treatment of the corrosive medium (43). Protective coatings (46).	
7. Methods of determining anticorrosive properties of protective coatings	47
Bibliography (There are 15 references, all Soviet)	49
Card 3/16	

Technology of Nonmetallic Coatings

607

Ch. II. Properties of Paints and Lacquers and Their Interaction with the Coated Surface	50
1. Properties of paints and lacquers	50
2. Properties of the solid surface	55
3. Action of film-forming liquids on solid surfaces	58
Bibliography (There are 14 references, of which 13 are Soviet and 1 English)	66
Ch. III. Scientific Principles of Producing Coatings	67
1. Basic facts of film formation	67
2. Coatings produced without chemical changes	68
3. Coatings produced by conversion into threefold polymers (trimers)	72
Conversion by means of polycondensation (72). Conversion by means of polymerization (75). Conversion of saturated linear polymers (80).	
Bibliography (There are 17 references, of which 13 are Soviet, 3 English, and 1 German)	84
Ch. IV. Properties and Varieties of Coatings	85
1. Vitreous condition of the film	85
2. Mechanical properties and deformation of films	89
Card 4/16	

Technology of Nonmetallic Coatings

607

3. Relationship between the structure of higher polymers and properties of films	92
4. Effect of the structure of low-molecular film-forming compounds on the properties of films	97
5. Coatings made with modified film-forming compounds	98
6. Multilayer heterogeneous coatings	100
Bibliography (There are 8 references, of which 7 are Soviet and 1 English)	104
Ch. V. Aging of Coatings	105
1. The nature of aging	105
2. Destruction by oxidation, and aging in the air	106
3. Thermal destruction and aging occurring during heating	108
4. Other types of destruction	110
5. Aging of film-forming compounds in solutions occurring during paint storage	113
6. Aging of paint and lacquer coatings	114
7. Effect of the aging of coatings on their resistance to weathering	117
Bibliography (There are 25 references, of which 22 are Soviet and 3 English)	122
Card 5/16	

Technology of Nonmetallic Coatings

607

Ch. VI. Preparation of the Metal Surface for Application of Coatings	126
1. Selection of a method for preparing the surface	126
2. Abrasive treatment of the surface	126
3. Thermal treatment of the surface	130
4. Chemical and electrochemical treatment of the surface	131
Pickling and dipping (131). Electrochemical pickling (135).	
5. Degreasing	137
Degreasing with organic solvents (137). Degreasing with alkaline solutions (138). Electrochemical degreasing (139).	
6. Application of ultrasonic vibrations for cleaning metal articles	139
7. Removal of old paint	142
8. Fields of application of various methods of preparing the metallic surface for painting	143
Bibliography (There are 8 references, all Soviet)	145
Ch. VII. Nonmetallic Inorganic Coatings	146
1. Purpose and fields of application	146
2. Oxide coatings on ferrous metals	147
Alkaline oxidation (147). Acid oxidation (148).	
3. Oxide coatings on nonferrous metals	149
4. Anodic coatings on nonferrous metals	151
5. Phosphate coatings	156
Phosphating under normal conditions (157). Accelerated phosphating (158). Cold phosphating (160). Phosphating by the spray method (160).	
Card 6/16	

Technology of Nonmetallic Coatings

607

TITLE: Embrittlement of the Steel 20KhN14S2 During the Process  
of Ageing at 500 to 650°C (Okhrupchivaniye stali  
20KhN14S2 v protsesse stareniya pri 500-650°)

PERIODICAL: Metallovedeniye i Obrabotka Metallov, 1958, Nr 8,  
pp 22-25 + 1 plate (USSR)

ABSTRACT: Austenitic stainless steels which are used for components  
operating inside corrosive media at elevated temperatures  
should be stable against inter-crystallite corrosion and  
possess sufficiently high mechanical properties during  
the entire service life. However, almost all the steels  
of this class are subjected to varying degrees of  
dispersion hardening which brings about embrittlement and  
inclination to develop inter-crystallite corrosion. The  
authors investigated the stability of the Soviet steel  
20KhN14S2 which is used as material for special power  
generation equipment; the chemical analyses of the  
experimental melts were as follows:

No.25557 - 0.08% C, 2.35% Si, 0.93% Mn, 20.2% Cr,  
13.28% Ni, 0.013% S, 0.025% P.  
No.25622 - 0.08% C, 2.83% Si, 1.14% Mn, 21.10% Cr,  
13.24% Ni, 0.012% S, 0.022% P.

Embrittlement of the Steel 20KhN14S2 During the Process of  
Ageing at 500 to 650°C

It was found that, compared with the austenised state, preliminary stabilisation only brings about a conservation of the properties during ageing at a certain level but does not influence the reduction or the increase in the degree of embrittlement. The change of the impact strength of stainless steels with a tendency to embrittlement during ageing appears to comply with a definite relation.

An analogous relation (decrease of the impact strength during ageing) was found to exist for the Steel EI448 investigated at the Central Works Laboratory of the imeni S. Ordzhonikidze Works. On the basis of the obtained results the authors arrived at the following conclusions:

1) During ageing in the temperature range 500 to 650°C the investigated steel has a tendency to embrittlement, thus reducing the ductility and particularly the impact strength.

2) The greatest reduction in the impact strength at a certain temperature takes place at the initial period of ageing, i.e. during the first 200 to 300 hours. During

Card 2/3

129-58-8-4/16

Embrittlement of the Steel 20KhN14S2 During the Process of  
• Ageing at 500 to 650°C

the further ageing the decrease in the impact strength is less intensive.

3) Stabilisation of the investigated steel after hardening does not influence appreciably the process of ageing. The final degree of embrittlement is practically equal in the case of hardening for obtaining austenite as well as in the case of hardening followed by stabilisation.

4) The investigated steel showed a tendency to inter-crystallite corrosion in tests carried out according to the method A-2 of the specifications GOST-6032-51.

There are 6 figures and 1 table.
